## [EPUB] IS THE EARTH'S CORE SOLID OR LIQUID DOWNLOAD

The immense pressure from the other parts of the planet keep the extremely hot iron of the Earth's inner core. They are unable to pass through liquid and whilst tracking them, scientists. Scientists say the earth is cooling. The core of the Earth is made up mainly of iron, in an outer liquid layer and an inner solid layer. It became clear that the core consists of a thick shell of liquid iron the outer core with a smaller, solid inner core at its center. When will Earth's core cool and does it mean the end? In the early part of the 20th century, geologists studied the vibrations (seismic waves) generated by earthquakes to learn more about the structure of the earth's interior.

The state of the various layers beyond the crust has been ascertained on the basis of geophysical evidences as it is not possible to physical. In 1936 Inge Lehmann reported that something reflects seismic waves from within the core. The outer core is in a liquid state and the inner core is a solid. Both the inner and outer core are formed mainly of iron and nickel. The least dense part of the Earth, the atmosphere, floats atop the watery oceans, which in turn float atop the Earth's crust, which lies above the more dense mantle, which itself cannot sink down into the densest section of the Earth: the core.
